Pests - Aphids

Aphids (Greenflies) are a tiny green insect that can cause problems to your lawn if found in large numbers.

You will see Sticky Grass - yellow/brown patches in the lawn - Stunted growth in plants nearby - discoloured leaves - visible sightings of green insects

Aphids are most common between March to September but are low in the insect food chain! Everything from ladybirds to wasps will feast on them.

Use chemical pesticides - spray all of the affected leaves.

Make sure that you also spray the underside of the affected leaves as well.

When it comes to Harrowden Turf, we take huge pride in our farms.

We are very careful to keep our turf healthy and strong, with pests kept under control. However, what we don’t do is shower our crops in pesticides!

Our farm has been carefully designed and grown to be part of a natural ecosystem. We do our very best to make sure that the grass is healthy and lush, whilst the soil, worms and microbes living around the farm are in the best possible heart.
All of this comes together to help us grow some of the best quality turf out there.
Keeping everything in balance like this means that, whilst you may see the very occasional larvae or beetle, our turf remains of the highest quality.
